Abstracts

Self-Cleaning Glass is a low maintenance glass made by depositing a thin layer of chemical that has photolytic and hydrophilic properties, which makes the glass easier to clean. Self-cleaning glass is fog and glare resistant. The material applied doesn't alter the usual properties of glass, such as mechanical, thermal and acoustic properties. Self-cleaning glass is a quintessential part of hard to reach areas for manual cleaning, such as facades and exterior shop fronts. It has a layer of titanium oxide over the surface that undergoes a chemical reaction on the surface, thus breaking dirt and other materials into smaller pieces that can be easily washed off by rain or on the application of water. The layer is also hydrophilic in nature, unlike normal glass, which is hydrophobic. As a result, on the application of water on the surface, water spreads evenly across the glass and wipes off the dirt.

Based on the Self-Cleaning Glass market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
