Abstracts

Semiconductors are materials whose electrical conductivity lies between the conductivity of metals and insulators. The property of exhibiting resistance to electrical conductivity in relation with temperature is inversely related to the property possessed by metals. The ability to manipulate their electrical conductivities by the addition of impurities makes them, the most suitable materials in the fabrication of diodes, transistors, integrated circuits, and other modern electronics. Silicon, Germanium and Gallium Arsenide are the most commonly used semiconductor materials.

Based on the Semiconductors market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
