Abstracts

The shaft locking device uses a keyless mechanical interference fit to securely connect the hub to the shaft to transmit torque or withstand axial thrust. This mechanical interference fit takes advantage of the screw tension in the shaft lock and converts it into radial pressure through an inclined plane. This pressure expands the shaft locking device, thereby eliminating the gap between the hub and the shaft. The shaft lock uses a frictional combination between the shaft lock and the shaft / hub to establish a zero-gap connection. The connection can be easily released to eliminate mechanical interference fits.
