## Abstracts

Radar is a mechanism that is used to determine the presence, range, speed of an incoming objects such as missiles, aircrafts, ships weather formation and spacecraft among others. Radar uses radio waves to determine the object and it can be mounted on an aircraft, motor vehicles, and ships. A radar comprises of a transmitter which produces electromagnetic waves, a transmitting antenna, a receiving antenna and a receiver and a processor to identify the object. Presently, the seas across the globe are becoming rapidly dangerous due to growing cross-border contingencies via seas, pirate attacks, and territorial disputes among others. Due to this, radars are a necessity on any ships. These shipborne radars are mounted on military and defense ships as well as cargo ships to identify enemy missiles, aircraft, and ships and also to determine the weather condition around the sea.

The major factor that is driving the market for shipborne radar is to encounter sea activities. Currently, pirate attacks or cross border attacks via sea have increased across the globe. This has led the military and defense to equip their ships with the latest radar technology in order to safeguard their ships and personnel. The cruise and cargo ship manufacturers are also incorporating their ships with the radar systems to protect the ships from any attacks and also to detect object in the sea. In addition, the shipborne radars are promoting an indigenous capabilities to the developing countries in order to develop independent defense forces which will in turn boost the shipborne radar market. Moreover, this shipborne radar systems is increasing the interest of ship manufacturers to integrate new enhanced technologies in the existing system as well as in the new vehicles.
