Abstracts

The material from which the shock absorber is made will affect its performance. The main bodies of these equipments are made of different materials, the most common of which are steel and aluminum.

The best shock absorber material should be suitable for vehicle type, driving conditions and other requirements. Other parts are also important. These include bushings, seals, springs and other components.

Steel shock absorbers are expensive, they are heavier than aluminum shock absorbers, so they are not suitable for applications such as racing cars. At the same time, steel shock is not allowed to be adjusted.

Aluminum shock absorbers are more expensive than steel shock absorbers and provide higher performance. And the aluminum shock absorber is light and adjustable.

Steel is the best choice for the spring material of shock absorber. It has excellent tensile properties and is not easy to lose elasticity.

The damper material used for the seal shall provide adequate protection against leakage, withstand pressure and continuously absorb the life of the damper. Synthetic rubber or polyurethane is suitable for this description.
