Abstracts

Aerogels are a synthetic ultra-light material derived from gel, where the liquid component of the gel is replaced with gas. Silica aerogel is the most common type of aerogel, and the most extensively studied and used. It is silica-based and can be derived from silica gel or by a modified Stober process. The lowest-density silica nanofoam weighs 1,000 g/m³, which is the evacuated version of the record-aerogel of 1,900 g/m³.^[20] The density of air is 1,200 g/m³ (at 20 °C and 1 atm). As of 2013, aerographene had a lower density at 160 g/m³, or 13% the density of air at room temperature.

Based on the Silica Aerogel market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
