## Abstracts

Silicon/carbon composite materials are prepared by pyrolysis of pitch embedded with graphite and silicon powders. The material modification by adding a small amount of CaCO<sub>3</sub> into precursor improves the initial reversibility ( $\eta=84\%$ ) and suppresses the capacity fade upon cycling. A little higher insertion voltage of the composites than commercial CMS anode material improves the cell safety in the high rate charging process.

Based on the Silicon-Carbon Composite Anode Materials market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
