Abstracts

Heparin, also known as unfractionated heparin (UFH), is medication which is used as an anticoagulant (blood thinner). Specifically it is used to treat and prevent deep vein thrombosis, pulmonary embolism, and arterial thromboembolism. It is also used in the treatment of heart attacks and unstable angina.[3] It is given by injection into a vein. Other uses include inside test tubes and kidney dialysis machines. Common side effects include bleeding, pain at the injection site, and low blood platelets. Serious side effects include heparin induced thrombocytopenia. Greater care is needed in those with poor kidney function. Heparin appears to be relatively safe for use during pregnancy and breastfeeding. Heparin is a naturally occurring glycosaminoglycan.
