Software-defined security (SDS) is a type of security model in which the information security in a computing environment is implemented, controlled and managed by security software.

Software Defined Security (SDS) is a security model in which information security in a computing environment is implemented, controlled, and managed by security software. Software-defined security is typically implemented in IT environments with minimal or no hardware-based security dependencies, such as cloud computing and virtualized infrastructure. Under the basic security policy, each new device created in the environment is automatically overwritten and controlled. This also ensures that the security scope and scalability of the underlying environment changes as the infrastructure/environment resources increase. In addition, as software-defined and managed security, environments can be moved or migrated within other data centers/IT facilities without impacting existing security policies and controls.

Based on the Software-Defined Security market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
