Abstracts

Solar cell paste is an electronic paste used to produce crystalline silicon solar cells. It can be divided into a front sol slurry, a back-silver paste and an aluminum paste. The front conductive paste collects the electricity generated by the solar cells, and then pastes the collected energy to the system. This slurry has a crucial influence on the conversion efficiency of the battery and therefore plays an important role in the performance cost ratio of the crystalline silicon solar cell. These conductive pastes account for 30% to 40% of the cost of manufacturing a single solar cell, and any small change in the slurry will have an impact on conversion efficiency.

Based on the Solar Cell Paste market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail.
