Abstracts

The spinal augmentation system is a medical device for performing minimally invasive surgery of the vertebrae. Surgery performed by the spinal pressurization system is used for pain management due to vertebral compression fractures. The primary function of the spinal augmentation system is to create a cavity in the vertebral body prior to injection of bone cement during minimally invasive surgery. Bone cement is injected into the cavity created by the spinal augmentation system to stabilize the fracture. The spinal augmentation system is used to perform different types of surgical procedures, such as vertebroplasty, balloon kyphoplasty, and the like.
