## Abstracts

Sputtering is a technique used to deposit thin films of a material onto a surface. By first creating a gaseous plasma and then accelerating the ions from this plasma into some source material, the source material is eroded by the arriving ions via energy transfer and is ejected in the form of neutral particles - either individual atoms, clusters of atoms or molecules. As these neutral particles are ejected they will travel in a straight line unless they come into contact with something - other particles or a nearby surface. If a 'substrate' such as a Si wafer is placed in the path of these ejected particles it will be coated by a thin film of the source material.

Based on the Sputtering System market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
