Abstracts

A submarine is a vessel capable of independent underwater operations. Submarines have the ability to dive and surface in water. Submarine is regarded as the most high-tech vessel in the world. Navy submarines have the capability to launch ballistic missiles, perform rescue operations, and also serve as the base of nuclear weapons. Navy submarines are equipped with in-house facilities and adaptability. This allows the naval military to live for months or even years underwater. Diesel-electric submarines made their first significant impact during the World War I. Several submarines were used as secret weapons in World War I and World War II.

Electric power is required to operate equipment and other in-house systems in submarines. For underwater and surface propulsion, submarines are equipped either with diesel engines, which run on fuel (diesel), or utilize nuclear reactors that use nuclear fission for propulsion. Several submarines are also equipped with battery banks for the supply of electrical power. During emergency situations, a fully charged battery is the only source of submarine propulsion. On surface, these submarines utilize diesel engine for propulsion, and thus charge the main storage battery. Once the batteries are completely charged, the submarine can head underwater and perform underwater operations. Thus, a submarine equipped with a charged battery is the only way a diesel submarine can actually submerge underwater.
