## Abstracts

Artificial lift refers to the use of manual methods to increase the flow of liquid (eg, crude oil or water) from a production well. Typically, this is achieved by using a mechanical device (called a pump or velocity column) in the well or by injecting gas into the liquid at a distance down the well to reduce the weight of the still water column. A new method called continuous belt transport (CBT) uses oil absorbing belts to extract from edge and idle wells. Artificial lift is required in wells when the pressure in the reservoir is not sufficient to lift the produced fluid to the surface, but is often used in naturally flowing wells (technically not needed) to increase the flow rate above natural flow. Flow rate. The fluid produced can be oil, water or a mixture of oil and water, usually mixed with a quantity of gas.

The natural decline in reservoir energy will affect the flow of oil, gas or water, resulting in instability and a drop in production. Artificial lifts are used for petroleum-based or liquid-loaded gas systems to increase and stabilize hydrocarbon production and minimize flow assurance and operational risks, such as slugs in subsea production systems. The artificial lifting method transfers energy to the generated fluid in order to reduce fluid density and head pressure or increase flow pressure. The three most commonly used artificial lifting methods in the seabed environment include: gas lift, subsea boost, electric submersible pump.

Any reservoir of fluid production creates “reservoir pressure”: a certain amount of energy or potential forces the fluid (liquid, gas, or both) into areas of lower energy or potential. This concept is similar to the water pressure in the municipal water supply system. Once the pressure in the production well is reduced below the reservoir pressure, the reservoir acts as a filling well, just like opening a valve on a water system.

Depending on the depth of the reservoir and the density of the fluid, the reservoir may or may not have sufficient potential to push the fluid towards the surface - deeper wells or heavier mixtures result in higher pressure requirements.
