Abstracts

Sulfur vulcanization or sulfur vulcanisation is a chemical process for converting natural rubber or related polymers into more durable materials by heating them with sulfur[1] or other equivalent curatives or accelerators.[2] Sulfur forms cross-links (bridges) between sections of polymer chain which results in increased rigidity and durability, as well as other changes in the mechanical and electronic properties of the material.[3] A vast array of products are made with vulcanized rubber, including tires, shoe soles, hoses, and conveyor belts.
