Abstracts

Surface plasmons are excited by light and are called planar surface plasmon resonance or localized surface plasmon resonance of nano-sized metal structures. This phenomenon is the basis of many standardized tools for measuring the absorption of materials onto metal flat surfaces or metal nanoparticle surfaces. It is the theoretical basis behind many color-based biosensor applications and different laboratory chip sensors. When the incident light is totally reflected on the metal surface through a prism or the like, the evanescent wave will couple with the surface plasmon wave to generate resonance.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Surface Plasmon Resonance (SPR) market covering all its essential aspects.
