Abstracts

Surface plasmons are excited by light and are called planar surface plasmon resonance or localized surface plasmon resonance of nano-sized metal structures. This phenomenon is the basis of many standardized tools for measuring the absorption of materials onto metal flat surfaces or metal nanoparticle surfaces. It is the theoretical basis behind many color-based biosensor applications and different laboratory chip sensors. When the incident light is totally reflected on the metal surface through a prism or the like, the evanescent wave will couple with the surface plasmon wave to generate resonance.

Based on the Surface Plasmon Resonance (SPR) market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.
