## Abstracts

Tailgating, also known as piggybacking, is one of the most common forms of a security breach, where an unauthorized entity passes through an access control point, either accidentally or by purpose, behind an authorized user. Access to unauthorized personnel in the facility exposes the organization to operational hazards and puts people's safety at risk. A tailgate detection system is an additional layer of security measure, deployed at access control points to detect tailgating incidences. Today's access control systems are designed to help control and manage authorized access into secure areas. Ensuring that every individual has properly presented a valid ID or successfully cleared biometric identification is a major challenge that security professionals face. A tailgate detection system offers an additional level of security for your facility during staffed or non-staffed hours.
