Abstracts

Technetium-99m is a medical radioisotope and used in gamma camera and SPECT for body imaging. SPECT is a highly sensitive technique to detect the parathyroid adenomas in the human body. It uses gamma camera for imaging purposes. Gamma camera is available separately for bone marrow and cardiac imaging, and is known as planar camera. Technetium-99m is widely used in hospitals and diagnostic centers and in some research institutes for diagnostic purposes. Rising number of cancer patients and cardiovascular ailments are expected to underpin the technetium-99m market. Technetium-99m is the preferred radioisotope for medical imaging due to its short half-life and appropriate energy emission for perfect image. It is generated by source named molybdenum, which is abundantly present on earth. However, the process of producing its daughter isotope is a rigorous task it represents a high value in terms of availability. Technetium-99m can be produced by molybdenum-99 and molybdenum-100 but the both sources are utilized by two different manufacturing process i.e. from nuclear reactor on a large scale and from cyclotron & accelerator on a small scale governed by any hospital facility. An injection of technetium-99m is combined with albumin and administered to the patient for scanning lungs, for brain scanning it is aggregated with hexamethylpropyleneamine oxime and for detecting the cancerous breast masses it is combined with methoxyisonitrile (MIBI).

The Technetium-99m market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
