Abstracts

The photomask consists of a fused silica (QZ) or glass (SL) substrate coated with an opaque film in which an exact copy of the device designer pattern is etched. The photomask has a function similar to that used in photography. Just like printing the same picture from film, the photomask can reproduce thousands of circuits and patterns. Photolithography techniques are used in photomask fabrication processes to create chrome patterns on quartz substrates. The completed photomask is then used as a photographic plate for an LSI, LCD, PCB, or the like.

Based on the Tft-LCD Photomask market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
