## Abstracts

A compressor is a type of machine or a system in a machine that executes the function of squeezing gas or air and makes it to take up less of space. Thermocompressor is one such type of compressor. Thermocompressor is a sort of pump-like device which do uses the Venturi effect created by converging-diverging nozzle that is fitted with the device. Thermocompressors converts the pressure energy of fluid to velocity energy. Thermocompressors are used in wide range of processes basically to save energy. Thermocompressors performs the function to compresses the low pressure steam to usable pressure levels and henceforth reclaim the heat energy in the low pressure steam, which otherwise would have been wasted. A thermocompressor is comprised of a motive steam nozzle, a mixing chamber, and a diffuser. Thermocompressor is mechanical device yet an indispensable system of complex steam and condensate system.
