Abstracts

Tire derived fuel (TDF) is composed of scrap or misshapen tires which can be either shredded or chipped to between 1 and 4 inches. These scrap tires can be collected from manufacturers, retail partners, local councils and processed at various plants. After they have been shredded, the TDF can be mixed with coal and other fuels such as wood and chemical waste. These mixtures can then be burned in concrete kilns, paper mills or even power plants.

Based on the Tire Derived Fuel (TDF) market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
