Abstracts

When applied to data security, tokenization is the process of replacing sensitive data elements with non-sensitive equivalents, which have no external or exploitable meaning or value. A token is a reference (ie, an identifier) that maps back sensitive data through a tokenization system. The mapping from raw data to tokens uses a method of making tokens unavailable without a tokenizing system, such as using tokens created from random numbers.

The Tokenization market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
