Abstracts

The purpose of tokenization is to swap out sensitive data—typically payment card or bank account numbers—with a randomized number in the same format, but with no intrinsic value of its own. This differs from encryption where a number is mathematically changed, but its original pattern is still “locked” within the new code—known as Format Preserving Encryption. Encrypted numbers can be decrypted with the appropriate key—whether through brute computing force, or through a hacked/stolen key. Tokenization is the process of removing sensitive data from your business systems by replacing them with an undecipherable token, so that it can store the original data in a secure cloud data vault.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Tokenization Solution market covering all its essential aspects.
