Abstracts

The purpose of tokenization is to swap out sensitive data—typically payment card or bank account numbers—with a randomized number in the same format, but with no intrinsic value of its own. This differs from encryption where a number is mathematically changed, but its original pattern is still “locked” within the new code—known as Format Preserving Encryption. Encrypted numbers can be decrypted with the appropriate key—whether through brute computing force, or through a hacked/stolen key.

Tokenization is the process of removing sensitive data from your business systems by replacing them with an undecipherable token, so that it can store the original data in a secure cloud data vault.

Based on the Tokenization Solution market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.
