Abstracts

A traction transformer is a large single-phase transformer fitted in the locomotive to feed power to traction motors and other auxiliaries. It takes 25kv AC from the overhead line as primary voltage. This voltage is then stepped down to say 1500volts and fed to a rectifier for running DC traction motors. Alternatively, the output of traction transformer may be fed to rectifier - inverter set for running three-phase AC traction motors.

Based on the Traction Transformer market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
