Abstracts

Transcranial magnetic stimulation (TMS) is a non-invasive method of brain stimulation which uses magnetic induction forces focusing on a particular area of the brain. The electromagnetic induction is generated from a coil using electricity and these pulses travel through the cranium to its specified receptor area of the brain. Several different methods of brain stimulation are available including electroconvulsive therapy and deep brain stimulation techniques; however, currently, the transcranial magnetic stimulation technique is the most widely adopted method for brain stimulation. Transcranial magnetic stimulator devices consist of a coil and a system for analyzing and detection of the effects of the therapy. The coils used in TMS equipment are of different materials such as a coil made up of magnetically inert material (air-core design) or a magnetically active material (solid-core design), depending upon the variations and biophysical characteristics required.

Based on the Transcranial Magnetic Stimulator market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
