Abstracts

Trauma fixation devices are used for treatment of internal injuries, such as dislocations, fractures, bruises and external injuries, burns, cuts, and others such injuries. Internal fixation devices are implanted into the body for the stabilization of severe fractures and dislocations, and deformity correction procedures. Whereas, external fixation devices are used to hold the bone in place by means of an external frame in cases of open fractures, severe soft tissue damage and burn injuries. These devices help to align fractured bones, prevent improper bone recovery, promote faster healing of external injuries, and complete repair of internal injuries.
