## Abstracts

A device for inspecting and determining the amount of opacity or turbidity in a solution is called a turbidimeter. The turbidity device mates the engaged shaft to the water being inspected. The light bar reflects the particles in the water and the combined light power is estimated by a photodetector of the turbidity device at 90 degrees to the light bar. The optical power differentiated by the turbidity device is straightforward relative to the turbidity of the water. The turbidity device uses a second light finder to correct for changes in optical power, shadow changes, and slight focus contamination.
