## Abstracts

Two-photon microscopes have ultra-sensitive direct detectors that record the tiniest internal structures deep inside tissues. Two-photon microscopy uses infrared excitation light to further penetrate tissue and has minimal scattering compared to excitation at longer wavelengths. For each excitation of the fluorophore, two infrared photons are absorbed and the excitation is confined to a tiny focal volume, making the image brighter and minimizing the phototoxicity to the specimen.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Two-Photon Microscopies market covering all its essential aspects.
