UV lamps contain a small amount of mercury, either in a free state within the lamp tube, or imbedded within the lamp tube's surface. When electricity is applied to the lamp, this mercury is "excited" and emits UV light. The exact wavelengths emitted depend on the vacuum pressure within the lamp tube itself. So called "Low Pressure" (LP) UV lamps are evacuated to relatively "low" pressures (between 1-10 Pa) and emit germicidal (I.E. UVC) light at a single UVC wavelength of approximately 254nm. So called "Medium Pressure" (MP) lamps are evacuated to what is termed "medium" pressure and emit a broader spectrum of UV light with higher intensities between around 254 – 265nm.

The Ultraviolet Lamps market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
