Abstracts

Typical UV curable resins consist of oligomers, monomers (which act as diluents), photopolymerization initiator, coinitiators (spectral sensitizer, reducing agents etc.) and various additives such as stabilizers, antioxidants, plasticizers, and pigments. The majority of commercial light cure resins are based on free radical curing acrylic compounds (acrylates). Free radical curing compositions are the most versatile curing systems in regard to product properties and monomers / oligomers available on the market. However, free radical acrylic systems are subject to oxygen inhibition, meaning oxygen in the air can stop the molecules at the surface from polymerizing, leaving a tacky surface layer.

Based on the UV Curable Resins market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
