## Abstracts

Creating a vacuum in a system requires moving all molecules of gas out of the system. Molecules will only move if there is a difference in pressure between two regions. The region that has the smaller number of molecules will be the low pressure region and the area with more molecules will be considered the high pressure. A device that can induce pressure difference between two regions of space is considered a pump. In a certain system, the pump that creates a vacuum is considered a vacuum pump.
