## Abstracts

The purpose of vertical tillage is to improve soil health, increase water penetration, and reduce soil erosion and compaction density. In varying degrees of soil movement, its purpose is not to invert the soil and leave a residue on the surface of the soil. It usually consists of a small forward disc that limits soil inversion and slicing residues to speed up the decomposition and feed the planter or seeder into the heavy residue field. Many times it also includes a deep ripping tool that breaks hard drives and compaction from traditional farming tools and heavy equipment such as large tractors and combine harvesters.

Based on the Vertical Tillage Machines market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
