## Abstracts

Voice Stroboscope is a flexible metal tube with a camera on the end that is inserted through the nose (after a numbing spray is applied) and allows ENT's (voice doctors) to view the vocal cords/folds in action! The camera emits a fast pace light (a 'strobe') that allows you to view the motion of the cords in a dramatically slowed down perspective (normal singing has the vocal folds vibrating between 100-1000 times per second, impossible to see without using strobe technology to slow down what you are seeing.)
