Abstracts

The Wankel engine is a type of internal combustion engine that uses an eccentric rotary design to convert pressure into rotational motion. All components rotate in unison in one direction, rather than a conventional reciprocating piston engine with a piston that changes direction violently. Compared to the more common reciprocating piston designs, the Wankel engine has the advantages of simplicity, smoothness, compactness, high speed per minute and high power-to-weight ratio. This is mainly because each rotor rotates to produce three power pulses, while the two-stroke piston engine produces one power per revolution, and the four-stroke piston engine produces one power pulse per revolution.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Wankel Engines market covering all its essential aspects.
