Abstracts

A water source heat pump operates much like a traditional air source heat pump except that it extracts and dissipates heat by way of water instead of air. Water source heat pumps, work on basically the same principle as air source heat pumps, but they extract heat from a body of water rather than the air. They do this by cycling water through a system of pipes that is laid out at the bottom of a body of water. As the water cycles through, it gathers heat from the lake or reservoir and then carries it back to your house.
