Abstracts

Weather radar is founded on basic Doppler radar principles, in which a transmitter emits short pulses of energy at a specific wavelength. These energy waves scatter upon contact with airborne particles, directing some energy back to the radar system. Computers associated with the system analyze key data about the signals—their strength, travel time, and frequency shift, for example—to determine the type and intensity of precipitation. Weather radar systems typically transmit radiation via a magnetron or klystron tube connected to a parabolic antenna.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Weather Radar Systems market covering all its essential aspects.
