## Abstracts

Weather radar is founded on basic Doppler radar principles, in which a transmitter emits short pulses of energy at a specific wavelength. These energy waves scatter upon contact with airborne particles, directing some energy back to the radar system. Computers associated with the system analyze key data about the signals—their strength, travel time, and frequency shift, for example—to determine the type and intensity of precipitation. Weather radar systems typically transmit radiation via a magnetron or klystron tube connected to a parabolic antenna.

Based on the Weather Radar Systems market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.

In chapters 8-13, we update the timely industry economic revitalization plan of the country-wise government.
