## Abstracts

Windshields typically consist of a layer of polyvinyl butyral (PVB) sandwiched between two sheets of glass. PVB works by removing air and utilizing heat to bond the windshield together while enhancing clarity. PVB can be separated from end-of-life windshields and used as a sustainable polymer. PVB is mainly used in the manufacture of items such as paints, textile or leather coatings, paper barrier coatings and anti-corrosion primers. Windshield PVB Recycling helps realize circular economy and reduce environmental pollution.
