Abstracts

Wire enamels are applied on copper and aluminum wires for primary insulation to avoid a short-circuit of the windings and thus a motor failure.

Wire enamels are applied on copper and aluminum round and flat wires used in motors, transformers, generators and electrical measuring instruments. They are cured onto the wires with heat. The resulting coating's main function is electrical insulation. Wire enamels are also described as primary insulation. The coated wires are sometimes called "magnet wires". Wire enamels are applied to copper and aluminum wires in up to 30 layers. This provides electrical insulation and helps the windings from short-circuiting. These wire enamels must also have very good chemical and thermal resistance, must adhere very well to copper or aluminum wire, and have outstanding mechanical stability.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Wire Enamels market covering all its essential aspects.
