## Abstracts

Zeolite molecular sieves are crystalline, extremely porous material, which belong to the category of aluminosilicates. These crystals are characterized by a 3D pore system, with the pores of defined diameter. The consistent crystallographic structure is shaped by tetrahedra's of (SiO<sub>4</sub>) and (AlO<sub>4</sub>). These tetrahedra's are the basic building blocks for numerous zeolite structures, i.e. zeolites X & A, the most common commercial adsorbents. Each zeolite crystal is only a few microns across. It is also extensively used as an absorbent on account of its sieve-like structure. These sieves are used for adsorption and separation across numerous industries including detergents, oil & gas and water treatment.

Based on the Zeolite Molecular Sieve market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
