Abstracts

Missiles as a payload delivery system are usually harder to detect (for size reasons) and subsequently difficult to intercept (for kinematic reasons) when compared to unguided or manned delivery systems while at the same time being more affordable than their manned alternatives. Besides, missiles are survivable, can strike swiftly and can breach many defenses. Over the years defense research departments across US, European Union and Asia has focussed in designing sophisticated Kill Vehicles, Navigation on Chip, Multi-Mode Seekers and New high energy Propellants. The advanced technology investments being made by defense departments are notified by capability gap assessments and focus on models that bring advanced capability to the nation's warfighter. The goal is to deliver capabilities that enable nation's missile force to keep pace with new and evolving threats.
