Abstracts

The global endpoint protection platform (EPP) market size is projected to grow from USD 17.4 billion in 2024 to USD 29.0 billion by 2029 at a Compound Annual Growth Rate (CAGR) of 10.7% during the forecast period. The proliferation of remote work and BYOD policies has expanded the attack surface, increasing the demand for advanced EPP solutions. As cyberattacks are rising against remote employees and personal devices, organizations realize the need for adaptive endpoint security. EPP solutions offer centralized management, better visibility, and threat-hunting capabilities to keep sensitive data safe and business operational in the changing digital world.

'By vertical, the healthcare segment accounts for the highest CAGR during the forecast period.'

The healthcare vertical is proliferating in the EPP market due to the increasing adoption of technology and the need to safeguard patients' critical information. Healthcare organizations are deploying electronic health records (EHRs) and connected medical devices; however, these organizations are increasingly being targeted by cyber attackers. Hence, the need for robust endpoint protection becomes inevitable. Endpoint protection solutions defend against data breaches such as theft or illegal access to patient information and potential identity thefts or financial scams while complying with HIPAA rules. Some of the leading solutions in the EPP market are SentinelOne Singularity, CrowdStrike Falcon, Sophos Intercept X, and Bitdefender GravityZone. These solutions provides state-of-the-art capabilities for threat detection and response

in real time against threats for an enhanced security posture and increased operational efficiency. With increased digitalization in healthcare, endpoint protection is critical to efficiently maintain the patient data security trust base and reduce the associated risks from emerging cyber threats.

'By Enforcement Point, the mobile devices segment accounts for a larger market share.'

Mobile devices are dominating the EPP market since they are part of the integral workforce of today. This general adoption has been accelerated because of remote work and cloud computing. A survey by the US Bureau of Labor Statistics shows that many businesses are dependent on teleworking, which has increased reliance on mobile devices even more. The increased usage has also increased vulnerability gaps, making Apple and Android devices a lucrative target for cybercriminals. According to the 2023 Global Mobile Threat Report, there has been a sudden increase in device compromise, therefore making the implementation of robust EPP solutions critical. EPP platforms provide anti-malware and antivirus with data encryption to protect mobile devices by putting complete security measures in place. They include total security measures with centralized management and real-time monitoring, two critical elements for the effective detection and mitigation of mobile threats within very differing environments. With increasing operations becoming more mobile-centric, sophisticated EPP solutions will turn into crucial mechanisms to protect sensitive organizational and personal data.
