## Abstracts

Radiation therapy is used as a part of cancer treatment to control or kill malignant cells. This technology makes use of ionising radiation as a part of its diagnostics. The radiation used in External beam radiation therapy comes from three types of particles: photons, neutron, and electron. Photon beams can reach tumours deep in the body.

Radiation works by making small breaks in the DNA inside cells. These breaks keep cancer cells from growing and dividing and cause them to die. Normal cells nearby can also be affected by radiation, but most recover and go back to working the way they should.

The increasing awareness spread by conferences and symposiums on the health benefits of radiotherapy coupled with rising investments by government and private associations to meet the increasing demand for cancer treatment has been augmenting the market positively. The increased prevalence of cancer and the growing utility of particle therapy for its treatment is another driver for this market.

The global market for radiotherapy equipment is expected to account for a value of USD 7 Billion in 2020 and it is anticipated to reach USD 11 Billion by 2028. This market is segmented based on Product Type, End-User, and Region. The CAGR for this market is estimated to be 6% during the forecast period. North American market is likely to have the largest market size followed by Europe. Canada and the US are major contributors to the North American market and the U.S is expected to maintain a growth momentum of approximately 5% during the forecast period.

APAC is predicted to be the fastest-growing segment owing to factors like increasing disposable income, improving healthcare infrastructure, and supportive government

activities. China is a major contributor to this segment and is expected to grow at a growth rate of 9% during the forecast period. Based on type, the external beam radiotherapy segment is expected to grow at the highest rate accounted to be roughly 6.2% during the forecast period. This is attributed to reduced radiation exposure. By end-user, hospitals constitute the largest share in the market due to the increasing prevalence of cancer.
