Abstracts

The Industrial Internet of Things (IIoT) is poised to significantly improve reliability, production, and customer satisfaction. Initially focusing on improving existing processes and augmented current infrastructure, IIoT will rely upon as well as integrate with certain key technologies including 5G and various forms of robotics.

5G will be a facilitator and an accelerator of the next industrial revolution, often referred to as Industry 4.0. Teleoperation and Telerobotics plays a profound role in industrial automation and the rapidly evolving IIoT arena. Robots and remote control systems enable various industries to control real machines/equipment by virtual object through master controlling interfaces.

Whether it is a factory setting, office environment, or enterprise operation in virtually any industry vertical, IIoT and supporting technologies will enable an increasingly smarter workplace. The supporting technologies include service robots, ubiquitous connectivity and communication technology, building automation and management systems, sensor equipped energy management system, cloud and edge enabled infrastructure, mobile device management, wearable networks, intelligent software application, and many more.
