5G subscription within public networks will exceed private through 2026, although the latter will experience a 20% faster growth rate, set to overtake the former by 2030

6G technologies are best characterized as ultra-secure, ultra-fast, ultra-reliable, and ultra-short-range oriented capabilities. 6G communication services will achieve initial commercialization in 2028 to 2030

Voice quality gained significant ground with Voice over LTE (VoLTE) with the deployment of 4G LTE networks. Voice over 5G (Vo5G) service will build on those advancements as evolved voice systems leverage combined 5G core network elements along with IP Multimedia Systems (IMS), VoLTE enhancements, 5G Evolved Packet Core (EPC), and other 5G New Radio (5G NR) 5G radio access network equipment such as smart antennas.

The vast majority of 5G service provider profits will result from the business market rather than the consumer segment. The latter will generate additional revenues, but

margins will be very thin as compared to business segments including enterprise, industrial, and government sectors. Accordingly, the business to business (B2B) market is viewed as significantly more attractive than the business to consumer (B2C) market for 5G. The analyst sees the 5G business services market developing as communication service providers offer both B2B direct as well as B2B to business (B2B2B) through third party channels.

One of the primary 5G B2B market opportunities will be fixed wireless access (FWA) to enterprise and industrial customers as a complement (not a replacement) to cable, fiber and Ethernet. For certain situations, such as time sensitive networks that require ultra-reliability, 5G will be an alternative to other wireless options. However, WiFi 6 will be a viable option vs. 5G for indoor, driven by scenario specific issues such as existing wireless, solution requirements, and overall economics.

The 5G business services market will also be very important in support of private wireless networks for both fixed wireless WAN connectivity for business-owned networks as well as carrier turn-key solutions involving both 5G and edge computing deployments. Communication service providers will position turn-key offerings as a “future-proof” alternative to enterprise and industrial customer network ownership. Part of this turn-key value proposition is carrier managed services as opposed to the business customer managing in-house and/or hiring a third party for network and/or application management.

LTE Advanced (LTE-A) represents a major step in the evolution of 4G technology, providing mobile coverage, higher performance, and greater connection stability. The 5G New Radio (NR) access technology is a part of 5G Radio Access Network (RAN) architecture that is composed of LTE evolution and millimeter wave (mmWave) technology that will be operable from sub-1 GHz to 24+ GHz in a range of the low band, mid-band, and high band.

A variety of complementary technologies will enable 5G NR supported systems including massive MIMO, advanced LPDC, TDD subframe, beamforming, and mmWave radiofrequency. For communication service providers, mmWave will bring both challenges and opportunities for general RAN infrastructure and in particular for the private Internet of Things (IoT) networks for industrial automation and mission-critical services for enterprise across many industry verticals.

The higher frequencies suffer from attenuation, which means they lose signal over distance and when they hit objects (even water vapor, but especially solid objects like

trees, buildings, etc.). This is why there is a need for massive MIMO and other multi-signal approaches to help, along with beam-forming to direct RF energy to where it is needed, but the signal is so directional in nature that it is very hard to maintain with a moving object.

The business drivers for satellite communications and applications are clear. Satellites provide coverage in areas where terrestrial wireless cannot. In fact, land-based wireless-only covers roughly 12% of the globe. Certain verticals, such as the maritime industry, require global coverage. This will be especially important as shipping begins to adopt autonomous transport as vessels will continue to require ship-to-shore communications as well as a new need for signaling with onboard ship sensors for navigation and ship controls.

The asset management industry also requires satellite systems for coverage in support of fleet tracking, supply chain management, and general asset tracking needs. The advent of advanced Internet of Things (IoT) solutions leveraging machine-to-machine communications and other supporting technologies enables anytime, anywhere, any type of asset tracking. Satellites provide seamless M2M communications for the IoT-based asset tracking market.

Smart cities represent a combination of solutions deployed in an urban environment to transform the administration and support of living and working environments to meet these challenges. Accordingly, Information and Communications Technologies (ICT) are transforming at a rapid rate, driven by urbanization, the industrialization of emerging economies, and the specific needs of various smart city initiatives. Smart city development is emerging as a focal point for growth drivers in several key ICT areas including AI, IoT, connected devices, broadband wireless, edge computing, and big data analytics.

We anticipate that smart cities will increasingly become highly surveilled cities. By way of example, there are so many CCTV cameras in the UK that the average Londoner is caught on camera 300 times per day. It is estimated that there is 1 CCTV camera for every 13 people in London, meaning that there are approximately 700,000 cameras in this dense urban environment.

Traditional surveillance solutions are typically overseen by humans and are prone to error. 5G allows for new solutions, including those that are completely automated and can actively blur individual details of those being recorded, while also monitoring their activity for crime or suspicious activity. This is possible due to the processing and

analysis of these video feeds being done locally through 5G edge clouds. Therefore, the software's decision making can be done with no human involvement.

Robotics is increasingly used to improve enterprise, industrial, and military automation. In addition, robots are finding their way into more consumer use cases as the general public's concerns fade and acceptance grows in terms of benefits versus risks. While many consumer applications continue to be largely lifestyle-oriented, enterprise, industrial, and military organizations utilize both land-based and aerial robots are used for various repetitive, tedious, and/or dangerous tasks. Adoption and usage are anticipated to rapidly increase with improvements to artificial intelligence, robotic form factors, and fitness for use, cloud computing, and related business models, such as robotics as a service.

The global robotics market is broadly segmented into enterprise, industrial, military, and consumer robotics. Major market segments that cross-over industries include healthcare bots, Unmanned Aerial Vehicles, and autonomous vehicles. Enterprise Robotics includes the use of robots for both business-to-business and business-to-consumer services and support. Functions include internal business operations and processes, delivery of goods and services, research, analytics, and other business-specific applications.

Smart machines collectively represent intelligent devices, machinery, equipment, and embedded automation software that perform repetitive tasks and solve complex problems autonomously. Along with AI, IoT connectivity, and M2M communications, smart machines are a key component of smart systems, which include many emerging technologies such as smart dust, neurocomputing, and advanced robotics. Smart machines will also benefit significantly from advancements in the convergence of AI and IoT, also known as the artificial intelligence of things (AIoT).

Teleoperation and telerobotics are both supported by ICT infrastructure including broadband communications, sensors, machine to machine (M2M) communications, and various Internet of Things (IoT) technologies. The combination of teleoperations, M2M/IoT, and 5G communications will enable entirely new use cases for robotics, supported by cloud-based robotics as a service business models.

Enhancements in wireless broadband are untethering teleoperation. Prior to 5G and Mobile Edge Computing (MEC), Teleoperation is largely relegated to fixed communications connections. 5G and MEC will enable Teleoperation anywhere there is 5G coverage, enabling many new consumer and industrial automation scenarios

involving robotics. In particular, we anticipate realization of substantial benefits as a result of the teleoperation market embracing cloud robotics deployment in conjunction with 5G in private wireless environments.

Expanding upon the trend started with technologies supporting 5G capabilities, 6G will be integrated with a set of previously disparate technologies. Several key technologies will converge with 6G including AI, big data analytics, and computing. 6G networks will extend the performance of existing 5G capabilities along with expanding the scope to support increasingly new and innovative applications across the realms of communications, sensing, wireless cognition, and imaging.

Whereas 5G leverages mmWave in the microwave frequency range, 6G will take advantage of even smaller wavelengths at the Terahertz (THz) band in the 100 GHz to 3 THz range. While the impact to the Radio Access Network (RAN) for 5G is substantial, it will be even bigger with 6G networks, which is driven largely by a substantial increase in frequency, which will facilitate the need for antennas virtually everywhere.
