## Abstracts

Cone-beam computed tomography (CBCT) systems are a variation of traditional computed tomography (CT) systems. Dental experts employ CBCT devices that circle around the patient and capture data with a cone-shaped X-ray beam. In comparison to standard CT, Cone Beam CT uses a larger imaging area and rotates the subject 360 degrees to gather the specified information in a single cycle. The 3D cone beam computed tomography (CBCT) system, on the other hand, basically produces 3D images of high diagnostic value in a care setting to detect subtle or magical fractures and their healing. The CONE BEAM CT device can improve the appearance of the patient's anatomy even in the presence of a metal implant, which is a common cause of noise in traditional CT imaging.
