## Abstracts

3D printing, also known as additive manufacturing, is a different technology from subtractive machining, based on the patient's X-ray computed tomography or magnetic resonance imaging to establish a CAD model (Computer aided design (CAD)), which requires the integration of modern technologies such as CNC technology, laser or electron beam technology and materials science, from the CAD model of the part to achieve the construction of a three-dimensional complex entity by positioning the material layer by layer. A 3D printed denture is usually a direct component of a denture product that is completed using 3D printing technology or a key process in which 3D printing technology is applied, replacing the traditional process of closing the denture.
