Abstracts

4D geographic information systems, also known as spatial-temporal GIS, have become extremely important in fields where geographic information systems are necessary for forecasting dimensions across time. In 4D GIS, the first three dimensions represent the coordinates used to define a physical space; the fourth dimension (4D) refers to time. The change can be the position of the object from one place to another or the change in patterns in surroundings like changing weather conditions or the spread of fire in a forest.
